# **Exercise 2: Basic Statistics**

#### Workflow

- 1. Create a folder on your Desktop and name it Cx1015\_[LabGroup], where [LabGroup] is the name of your Group
- 2. Download the .ipynb files and data files posted corresponding to this exercise and store in the aforesaid folder
- 3. Open Jupyter Notebook (already installed on the Lab computer) and navigate to the aforesaid folder on Desktop
- 4. Open and explore the .ipynb files (notebooks) that you downloaded, and go through "Preparation", as follows
- 5. The walk-through videos posted on NTU Learn (under Course Content) may help you with this "Preparation" too
- 6. Create a new Jupyter Notebook, name it Exercise2\_solution.ipynb, and save it in the same folder on the Desktop
- 7. Solve the "Problems" posted below by writing code, and corresponding comments, in Exercise2\_solution.ipynb

Try to solve the problems on your own. Take help and hints from the "Preparation" codes and the walk-through videos. If you are still stuck, talk to your friends in the Lab to get help/hints. If that fails too, approach the Lab Instructor.

Note: Don't forget to import the Essential Python Libraries required for solving the Exercise. Write code in the usual "Code" cells, and notes/comments in "Markdown" cells of the Notebook. Check the preparation notebooks for guidance.

## Preparation

M2 BasicStatistics.ipynb Check how to import the Pokemon data and perform basic Statistics

You will need the CSV data file pokemonData.csv to use this code

You will need the CSV data file pokemonData.csv to use this code

#### **Problems**

#### **Problem 1: Data Preparation**

Download the dataset train.csv and the associated text file data\_description.txt posted with this Exercise. The dataset and description are collected from Kaggle. You may also want to download the files directly from the Kaggle Competition (Login > Go to "Data" > "Download All"). Either way, read the competition description to get an idea about the task.

Source: Kaggle Competition: House Prices: https://www.kaggle.com/c/house-prices-advanced-regression-techniques

- a) Import the "train.csv" data you downloaded (either from NTU Learn or Kaggle) in Jupyter Notebook.
- b) What are the data types ("dtypes") int64/float64/object of the variables (columns) in the dataset?
- c) Extract only the variables (columns) of type Integer (int64), and store as a new Pandas DataFrame.
- d) Open the "data\_description.txt" file you downloaded (either from NTU Learn or Kaggle) in Wordpad. Read the description for each variable carefully and try to identify the "actual" Numeric variables. Categorical variables are often "encoded" as Numeric variables for easy representation. Spot them.
- e) Drop non-Numeric variables from the DataFrame to have a clean DataFrame with Numeric variables.

#### **Problem 2: Statistical Summary**

Now that you have a "clean" DataFrame with only Numeric variables, we can safely perform standard statistics.

- a) Find the Summary Statistics (Mean, Median, Quartiles etc.) of SalePrice from the Numeric DataFrame.
- b) Visualize the summary statistics and distribution of SalePrice using standard Box-Plot, Histogram, KDE.
- c) Find the Summary Statistics (Mean, Median, Quartiles etc) of LotArea from the Numeric DataFrame.
- d) Visualize the summary statistics and distribution of LotArea using standard Box-Plot, Histogram, KDE.
- e) Plot SalePrice (y-axis) vs LotArea (x-axis) using jointplot, and check the Correlation between the two.

### **Data Description**

Note carefully that Categorical variables can be "encoded" in either of two ways, as follows.

```
MSSubClass: Identifies the type of dwelling involved in the sale.
                1-STORY 1946 & NEWER ALL STYLES
        20
        30
                1-STORY 1945 & OLDER
                                                      Numeric Encoding
        40
                1-STORY W/FINISHED ATTIC ALL AGES
                                                      Levels represented as
        45
                1-1/2 STORY - UNFINISHED ALL AGES
                                                      individual Integers
        50
                1-1/2 STORY FINISHED ALL AGES
        60
                2-STORY 1946 & NEWER
                2-STORY 1945 & OLDER
        70
        75
                2-1/2 STORY ALL AGES
        80
                SPLIT OR MULTI-LEVEL
        85
                SPLIT FOYER
        90
                DUPLEX - ALL STYLES AND AGES
       120
                1-STORY PUD (Planned Unit Development) - 1946 & NEWER
       150
                1-1/2 STORY PUD - ALL AGES
       160
                2-STORY PUD - 1946 & NEWER
                PUD - MULTILEVEL - INCL SPLIT LEV/FOYER
       180
       190
                2 FAMILY CONVERSION — ALL STYLES AND AGES
MSZoning: Identifies the general zoning classification of the sale.
       A Agriculture
       C Commercial
                                                      Character Encoding
       FV Floating Village Residential
                                                      Levels represented as
       I Industrial
                                                      individual Characters
       RH Residential High Density
       RL Residential Low Density
       RP Residential Low Density Park
       RM Residential Medium Density
```

#### **Bonus Problem**

Extract all variables (columns) of type Integer (int64) or Float (float64), and store as a new Pandas DataFrame. Read the description for each variable carefully and try to identify the actual Numeric variables amongst these.

Drop non-Numeric variables from the DataFrame to have a clean DataFrame with only the Numeric variables.
